PawPulse - Wearable and app for dog health monitoring

Executive Summary

PawPulse is a smart collar that tracks dogs' activity, sleep, and resting heart rate, with an app that alerts owners to early signs of health problems.

Problem

Dogs hide illness, and owners often notice problems late. Vet visits are expensive and early detection can reduce costs.

Market

There are 65 million dog-owning households in the US. If 1 percent buy our collar at 129 USD, that is 84M USD in revenue. Competitors include Fi, Whistle, and Garmin; we believe our health-alert algorithm is more accurate, though we have not yet validated it with a vet study.

Business Model

Hardware at 129 USD (unit cost 46 USD at 5,000 units, quote from contract manufacturer attached) plus 7.99 USD/month subscription. Expected subscription attach rate 60 percent, based on industry benchmarks.

Financials & Funding Ask

Seeking 900,000 USD for tooling, a 5,000-unit first run, and a veterinary validation study. A working prototype exists; 40 beta testers are using it. No revenue yet. Year-2 revenue projected at 2.1M USD, which assumes 12,000 units sold with marketing spend of 120,000 USD.

Team

Founder is a mobile app developer; hardware engineer is a freelance contractor. No veterinary or data science expertise on the team yet; plan to hire a part-time veterinary advisor.

Risks

Hardware recall risk and battery issues. Competitors may add similar features. Regulatory status as a non-medical wellness device assumed but not confirmed.
